1. Introduction

The Maryland Transit Administration (MTA) is preparing an Alternatives Analysis and Draft Environmental Impact Statement (AA/DEIS) to study a range of alternatives for addressing mobility and accessibility issues in the corridor between Bethesda and New Carrollton, Maryland. The corridor is located in Montgomery and Prince George's Counties, just north of the Washington, DC boundary. The Purple Line would provide a rapid transit connection along the 16-mile corridor that lies between the Metrorail Red Line (Bethesda and Silver Spring Stations), Green Line (College Park Station), and Orange Line (New Carrollton Station). This *Travel Demand Forecasting Technical Report* describes the methodology used for the travel demand forecasting and presents the results of that analysis.

This Technical Report presents the methodology and data used in the analyses documented in the Purple Line Alternatives Analysis/Draft Environmental Impact Statement. The results presented in this report may be updated as the AA/DEIS is finalized and in subsequent study activities.

Maryland Transit Administration (MTA) developed a common travel demand forecasting model and procedures for two Alternatives Analyses in two separate corridors in the Washington DC regional modeling area. The intention was to use the same No Build forecast as the starting point for future forecasts for both the Corridor Cities Transitway (CCT) and the Purple Line (PL). Preliminary work on the CCT forecasts indicated that some enhancements to the Washington Metropolitan Council of Governments (MWCOG) travel model would be required to provide transit corridor-level alternative analysis travel forecasts information.

The enhanced model described in this document is referred to as the Maryland Alternatives Analysis Model, or the MDAA. It is based on the officially adopted MWCOG model version 2.1D#50, as modified by MWCOG for the 2007 Conformity Analysis, and referred to here as the COG Model. The COG model is a classic four step model with a static six iterations of feedback through trip generation, distribution, mode choice, and assignment. The COG mode choice model is a simple multinomial model that relies upon the path builder to distinguish choices among primary transit modes. It does not disaggregate transit trips into the various transit modes or transit access modes, nor does it accommodate transit assignment.

The COG Model was not fully developed to accommodate comprehensive transit analysis, and therefore a MWCOG model transit component post processor was developed, typically referred to as the COG Transit Component. Starting from the person trip tables that result from the sixth iteration of the full model feedback, the Transit Component applies a more sophisticated mode choice model which distinguishes between bus, bus/Metrorail, Metrorail only and commuter rail trips. Walk, Park-and-Ride, and Kiss-and-Ride trips are modeled separately and transit assignment is included. Full documentation of the Transit Component can be found in Post MWCOG - AECOM Transit *Component of Washington Regional Demand Forecasting Model Users Guide*, prepared by AECOM Consult, Inc., and dated March 2005.

The 2005 Transit Component was the starting point for modifications made for initial rounds of forecasts for the CCT. Additional modifications included edits to the networks, zones, and all files that are related to zonal-based demographics and walk percentages, to address corridor-level

conditions and reporting needs. Changes were made to the Transit Component scripts in order to accommodate the new zone structure and network modifications. The resulting model, referred to here as the CCT Model, was the starting point for the MDAA.

The MDAA starts with the CCT Model and incorporates modifications to improve confidence in transit forecasts in these two corridors. The MDAA replaces the COG Model home-based work trip distribution with the CTPP. The mode choice model is a nested logit model with bus, Metrorail, commuter rail, light rail and bus rapid transit alternative transit modes. A park-and-ride station capacity restraint model was implemented to account for limited capacity at key stations.

1.1.   Background and Project Location

Changing land uses in the Washington metropolitan area have resulted in more suburb-to-suburb travel, while the existing transit system is oriented toward radial travel in and out of downtown Washington, DC. The only transit service available for east-west travel is bus service, which is slow and unreliable. A need exists for efficient, rapid, and high capacity transit for east-west travel. The Purple Line would serve transit patrons whose journey is solely east-west in the corridor, as well as those who want to access the existing north-south rapid transit services, particularly Metrorail and MARC commuter rail service.

The corridor has a sizeable population that already uses transit and contains some of the busiest transit routes and transfer areas in the Washington metropolitan area. Many communities in the corridor have a high percentage of households without a vehicle, and most transit in these communities is bus service. Projections of substantial growth in population and employment in the corridor indicate a growing need for transit improvements. The increasingly congested roadway system does not have adequate capacity to accommodate the existing average daily travel demand, and congestion on these roadways is projected to worsen as traffic continues to grow through 2030.

A need exists for high quality transit service to key activity centers and to improve transit travel time in the corridor. Although north-south rapid transit serves parts of the corridor, transit users who are not within walking distance of these services must drive or use slow and unreliable buses to access them. Faster and more reliable connections along the east-west Purple Line Corridor to the existing radial rail lines (Metrorail and MARC trains) would improve mobility and accessibility. This enhanced system connectivity would also help to improve transit efficiencies. In addition, poor air quality in the region needs to be addressed, and changes to the existing transportation infrastructure would help in attaining federal air quality standards.

1.1.1.   Corridor Setting

The Purple Line Corridor, as shown in Figure 1-1, is north and northeast of Washington, DC, with a majority of the alignment within one to three miles of the circumferential I-95/I-495 Capital Beltway.

Figure 1-1: Project Area

Figure 1-1: Project Area
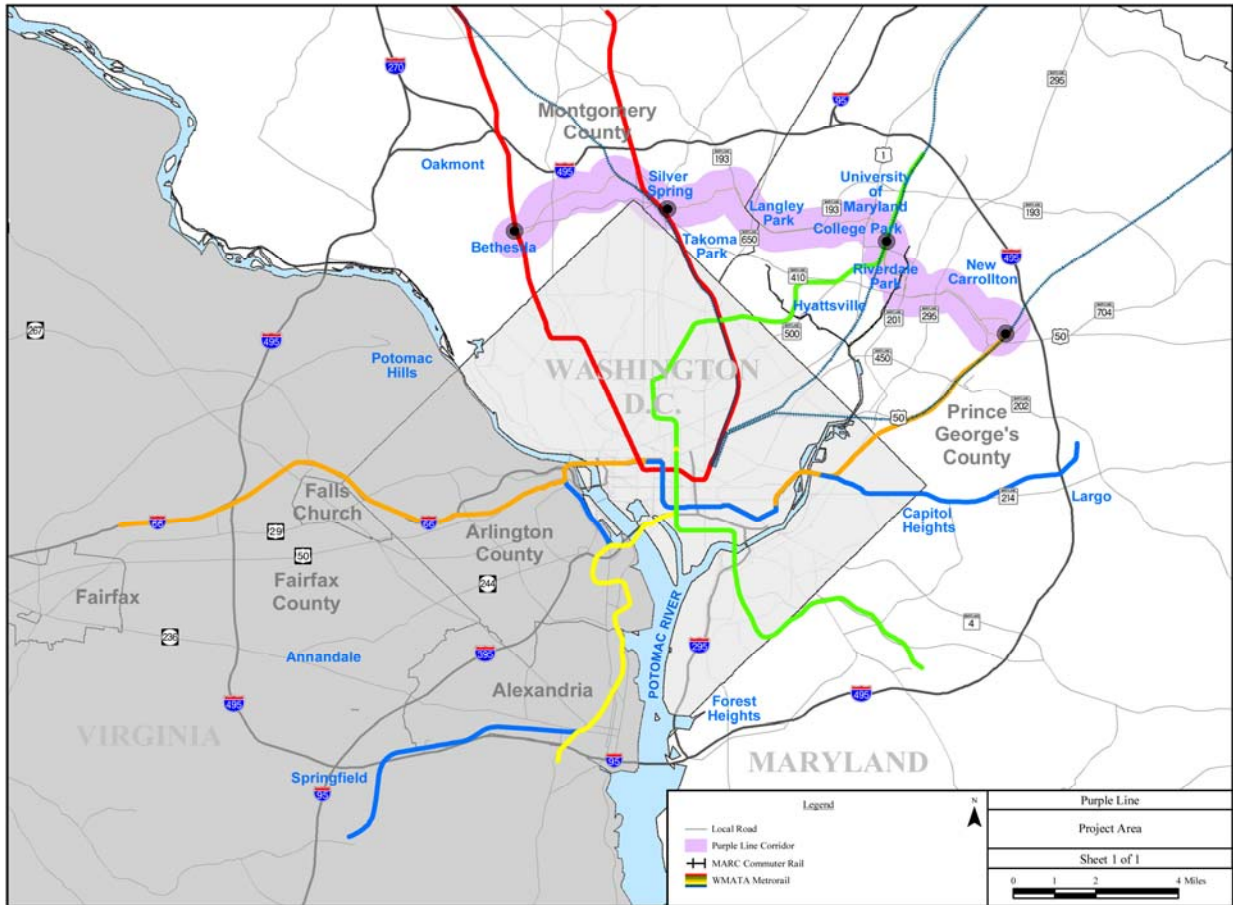

2. Travel Forecasts for Alternatives Analysis

This section provides descriptions of the alternatives for which travel forecasts were prepared for the alternatives analysis and DEIS, as well as a presentation of the results and discussion of the findings. In Chapter 3, more detailed information and forecast results are presented for each alternatives.

2.1. Alternatives Retained for Detailed Study

The Purple Line study has identified eight alternatives for detailed study, shown on Figure 2-1. The alternatives include the No Build Alternative, the Transportation System Management (TSM) Alternative, and six Build Alternatives. The Build Alternatives include three using bus rapid transit (BRT) technology and three using light rail transit (LRT) technology.

All alternatives extend the full length of the corridor between the Bethesda Metro Station in the west and the New Carrollton Metro Station in the east, with variations in alignment, type of running way (shared, dedicated, or exclusive), and amount of grade-separation options (e.g. tunnel segments or aerial). For purposes of evaluation, complete alignments need to be considered. These alternatives were used to examine the general benefits, costs, and impacts for serving major market areas within the corridor.

2.2. No Build Alternative

Existing transit service in the corridor is provided by WMATA Metrorail and Metrobus, Montgomery County Ride On local bus, Prince George's County TheBus local bus, the University of Maryland Shuttle, MARC commuter rail, and Amtrak. Table 2-1 lists the principal existing transit service within the corridor.

The transit service levels in the Constrained Long Range Plan (CLRP) are assumed for the No Build Alternative except for the Bethesda to Silver Spring segment of the Purple Line.

Figure 2-1: Alternative Alignments

Figure 2-1: Alternative Alignments
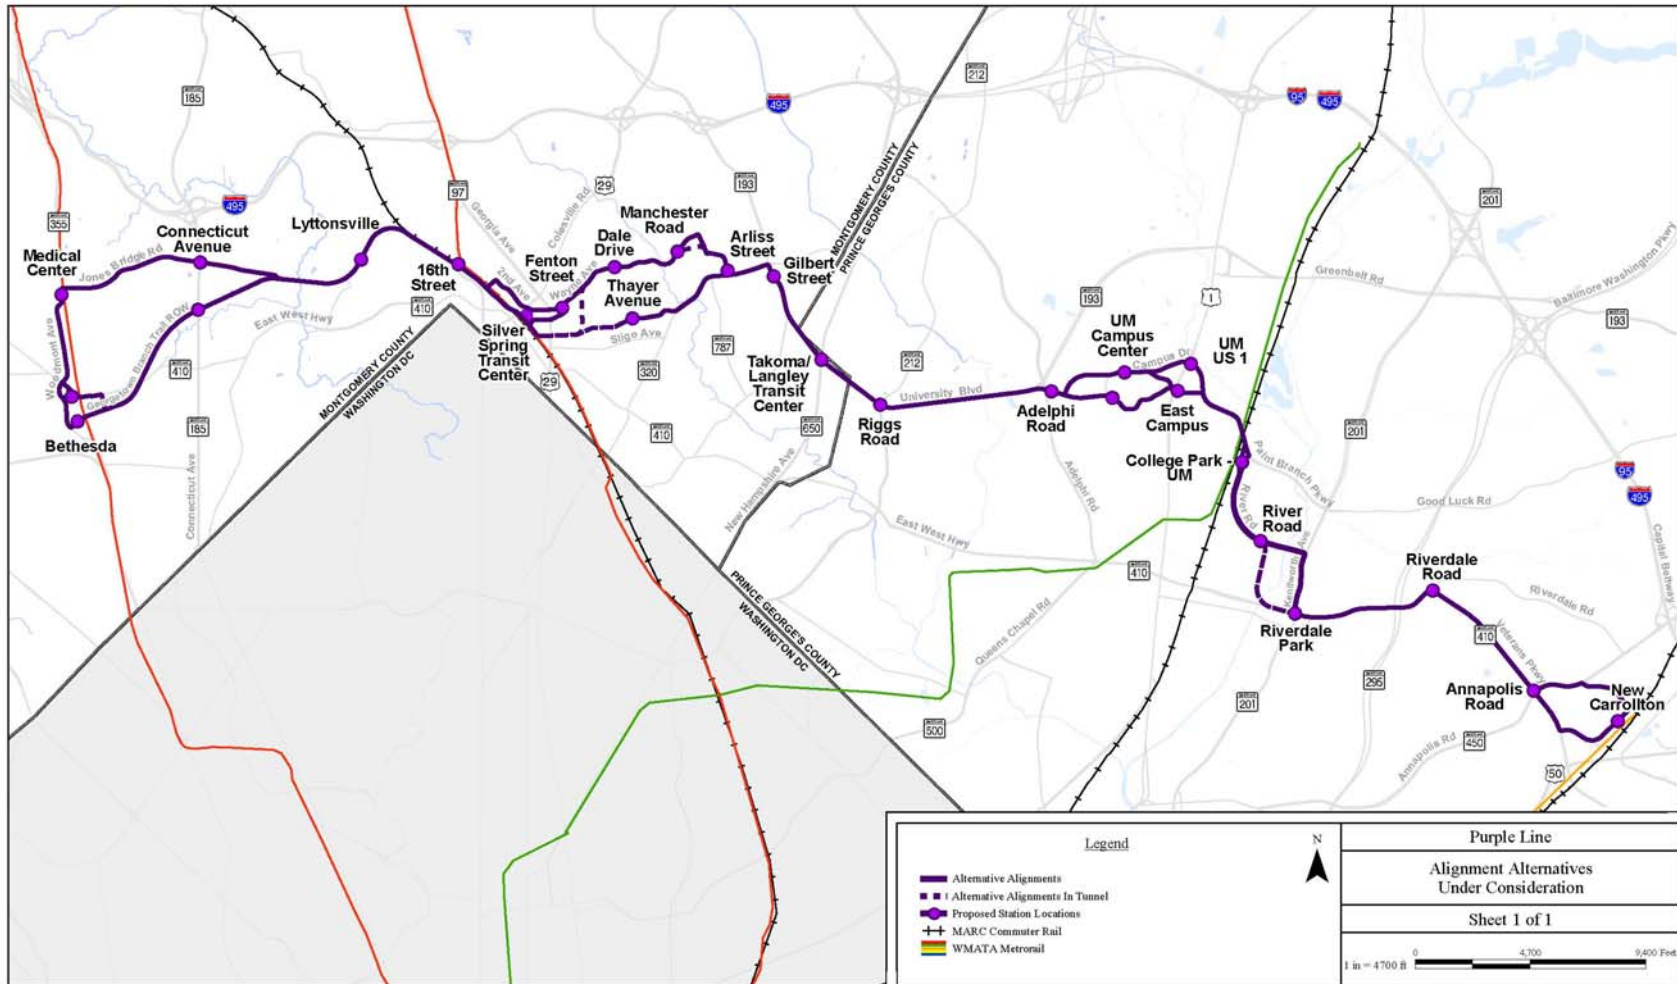

Table 2-1: Existing Transit Service

Route	Terminal & Intermediate Points
Metro Red Line	Shady Grove – Glenmont
Metro Green Line	Greenbelt – Branch Avenue
Metro Orange Line	Vienna/Fairfax/GMU – New Carrollton
J1, J2, J3	Montgomery Mall – Bethesda – Silver Spring Metro
J4	Bethesda Metro – Silver Spring – College Park Metro
C2	Wheaton Metro – Greenbelt Metro
C4	Twinbrook Metro – Prince George's Plaza Metro
F4	Silver Spring – New Carrollton
F6	Silver Spring – New Carrollton
Ride On 15	Silver Spring Metro – Langley Park
TheBus 17	Langley Park – UM – College Park Metro
UM Shuttle 111	UM – Silver Spring Metro
UM Shuttle 104	UM – College Park Metro
MARC Brunswick Line	Washington – Rockville – Gaithersburg - Brunswick
MARC Penn Line	Washington – BWI Thurgood Marshall Airport – Baltimore –Perryville
MARC Camden Line	Washington – Baltimore
Amtrak Northeast Corridor	Washington – New York and points north and south

Transit projects in the Maryland Consolidated Transportation Program (FY 2007-2012) located within the corridor, and expected to be in place by 2030, include the following:

- **Southern Entrance to Bethesda Metro Station** - A new entrance to the mezzanine of the Bethesda Metro station at the southern end of the platform. This second entrance was anticipated at the time of the initial construction of the station, but left unbuilt until ridership required it. The construction of this project is funded and design is currently underway.

- **Silver Spring Transit Center** - This project provides a fully integrated transit center at the Silver Spring Metro Station. It will serve the Metrorail Red Line and the MARC Brunswick Line. It will include bus bays for Metrobus and Ride On, an intercity bus facility, a taxi queue area, a kiss-and-ride facility, and a MARC ticketing office. Construction has begun on this facility and should be complete by 2010. Provisions have been made in the Transit Center design to accommodate a Purple Line guideway and platforms. For the Low Investment BRT Alternative, the buses would use the middle level bus facility.

- **Takoma/Langley Park Transit Center** - A new transit center will be built at the northwest corner of the University Boulevard and New Hampshire Avenue intersection. It is expected to be completed by 2010. All the Purple Line Build Alternatives would have a station at this transit center.

The Metrorail system opens at 5 AM on weekdays and 7 AM on weekends. It operates until midnight Sunday through Thursday and until 3 AM on Fridays and Saturdays.

Metrobus schedules vary by route, with most routes running every day. Ride On schedules also vary by route, with most routes running daily. TheBus buses operate Monday through Friday, with no service on weekends or holidays. Bus headways on all three systems vary by time of day. Table 2-2 lists the headways of the bus routes within the corridor. Transit service to the National Naval Medical Center/National Institutes of Health area is provided from Silver Spring and points east via the J1 route, while the Metrorail Red Line Medical Center Station connects to the entire rail-bus network.

Table 2-2:   Year 2030 Bus Headways within the Corridor (minutes)

Route	Terminal and Intermediate Points	Early Morning	AM Peak	Midday	PM Peak	Evening	Saturday	Sunday
J1	Montgomery Mall-Medical Center-Silver Spring Metro	--	20	--	20	---	--	--
J2	Montgomery Mall-Bethesda-Silver Spring Metro	20	17	20	24	15	20	25
J3	Montgomery Mall-Bethesda-Silver Spring Metro	--	17	--	24	--	--	--
J4	Bethesda Metro-Silver Spring-College Park Metro	--	20	--	20	--	--	--
C2	Wheaton Metro-Greenbelt Metro	--	22	30	16	--	30	--
C4	Twinbrook Metro-Prince George's Plaza Metro	10	22	30	16	30	30	16
F4	Silver Spring – New Carrollton	12	12	40	15	--	30	60
F6	Silver Spring – New Carrollton	--	20	40	30	--	--	--
Ride On 15	Silver Spring Metro-Langley Park	15	4	12	4	30	12	15
TheBus 17	Langley Park-UM-College Park Metro	45	45	45	45	--	--	--
UM Shuttle 111	UM – Silver Spring Metro	--	35	75	45	30	--	--
UM Shuttle 104	UM – College Park Metro	8	8	12	8	20	20	20

Since no changes are anticipated to the bus network under the No Build Alternative, it is not anticipated that current service levels would change significantly, except for the impacts of growing roadway congestion, which is expected to result in lengthened bus running times and longer travel times for all vehicles.

The No Build Alternative would not include any alterations to the existing Metrobus, Ride On, or TheBus systems. It would not include addition of a new mode or new exclusive right-of-way, and would therefore not significantly increase the reliability of the existing transit system. It is expected that increasing roadway congestion will continue to decrease the reliability of the bus service, its adherence to its operational schedule, and the predictability of expected headways and transit travel times.

2.3. TSM Alternative

The TSM Alternative would include enhanced bus service in the corridor and a new through-route from Bethesda to New Carrollton replacing the existing J4 route and adding service on portions of the F4/F6 routes between College Park and New Carrollton. The TSM bus service would consist of a limited-stop bus route that would make stops consistent with those of the Build Alternatives. The core service improvements under the TSM Alternative are limited-stop bus service, selected intersection and signal preference strategies, and upgrades to bus stop amenities.

A principal difference between the TSM and the Build Alternatives is that the TSM service would operate on East West Highway between Bethesda and Silver Spring, rather than along a new guideway facility along the Georgetown Branch and Metropolitan Branch railroad rights-of-way between Bethesda and Silver Spring, as with the Build Alternatives (except under the Low Investment BRT Alternative, which runs along Jones Bridge Road.) Along East West Highway, stops would be located at Connecticut Avenue and at Grubb Road.

The TSM service would provide faster one-seat rides between major activity centers, including Medical Center Metro Station, Bethesda Metro Station, Silver Spring Metro Station, Takoma Park, Langley Park, University of Maryland, College Park Metro Station, and New Carrollton Metro Station. This route would also serve transfers to bus routes operating on radial streets, including those on Wisconsin Avenue, Connecticut Avenue, Colesville Road, Georgia Avenue, New Hampshire Avenue, Riggs Road, Adelphi Road, US 1, Kenilworth Avenue, and Annapolis Road. It would serve the long-haul trips now carried by WMATA J2/J3, Ride On 15, and, to a degree, WMATA C2/C4, and is estimated would serve nearly 80 percent of the passengers now boarding the existing routes along this corridor.

Transit service to the National Naval Medical Center/National Institutes of Health area would be provided from Silver Spring and points east through the enhanced J1 service with intersection, operational, or service modifications. The Metrorail Red Line Medical Center Station would continue to provide connectivity to the entire rail-bus network.

Because of the importance of serving the trips that interface with the Metrorail services in the Purple Line corridor, the TSM span of service would match the Metrorail span of service. The Metrorail system opens at 5 AM on weekdays and 7 AM on weekends. It operates until midnight Sunday through Thursday and until 3 AM on Fridays and Saturdays.

The fare structure for the TSM service would be the same as under the No Build Alternative, recognizing that fares would increase over time. SmartCard, or some other means of electronic fare collection, may enable an integrated fare structure and convenient transfer with other transit services in the corridors.

End-to-end, the TSM route is 16 miles long, requiring about 108 minutes of running time with an average round trip speed of 9 miles per hour. Today, the bus routes along the alignment operate in very difficult circumstances with a wide range of times in each direction and between the AM and PM. Anecdotal reports from WMATA indicate that the J4 route may require 50 percent

more time than scheduled on certain runs to complete its trip. These conditions complicate schedule preparation and operations planning. It is assumed TSM measures would somewhat mitigate these conditions; however, 2030 background traffic volumes and traffic congestion levels will be far greater than they are today.

Table 2-3: Year 2030 TSM Bus Headways (minutes)

Route	Terminal and Intermediate Points	Early Morning	AM Peak	Midday	PM Peak	Evening	Weekend
TSM	Bethesda – New Carrollton	10	6	10	6	10	20
J1	Medical Center – Silver Spring	--	20	--	20	--	--
J3	Eliminate; replace with Ride On 15 service	--	--	--	--	--	--
C2	Terminate at Langley Park Langley Park – Greenbelt	30	15	20	15	30	30
C4	Twinbrook Metro – Prince George's Plaza Metro	10	8	15	8	20	20
F4	Silver Spring – New Carrollton	12	10	30	10	--	30
F6	Terminate at Prince George's Plaza Prince George's Plaza – New Carrollton	--	15	30	15		--
Ride On 15	Bethesda – Langley Park (extend to Bethesda)	15	15	15	15	30	15
TheBus 17	Langley Park–UM–College Park Metro	45	45	45	45	--	--

The TSM Alternative includes modifications to existing Metrobus routes intended to improve reliability, including limited-stop bus service, and intersection improvements and signal priority at certain intersections. At intersections where queue jump lanes and signal priority would be implemented, transit's reliability would increase because the effects of congestion at these locations would be reduced. In addition, the limited-stop route would provide faster connections between major origins and destinations, as well as providing one-seat rides.

However, there is only limited opportunity for improving transit service reliability using signal preference strategies in the corridor. The major radial roadways that cross the corridor, such as Connecticut Avenue, Georgia Avenue, New Hampshire Avenue, Riggs Road, Adelphi Road, US 1, Kenilworth Avenue, and Annapolis Road, are the major sources of delay and unreliability. These roadways carry very heavy arterial traffic flows into and out of Washington, DC and other major activity centers. There is very little opportunity to introduce signal preferences at these intersections without causing a major exacerbation of traffic congestion. Queue jump lanes, however, do provide a travel time reliability advantage enabling transit vehicles to get to the intersection and limit the delay to one or two traffic signal cycles.

2.4. Build Alternatives

Six Build Alternatives are under consideration. They include two transit modes, BRT and LRT. Each mode is being analyzed at three potential levels of investment: low, medium, and high. All of the Build Alternatives would extend the full length of the corridor between the Bethesda

Metro Station and the New Carrollton Metro Station with some variations in alignment location, type of running way (shared, dedicated, or exclusive), and amount of grade separation. The decision to construct dedicated lanes is dependent on the results of the operations modeling (which assumes no dedicated lanes), as well as construction costs and potential environmental benefits and impacts. Each of the Build Alternatives is described briefly below.

2.4.1.   Alternative 3 - Low Investment BRT

The Low Investment BRT Alternative would primarily use existing streets to minimize capital costs. It would incorporate improvements to traffic signals (including signal priority where possible), signage, and travel lanes in appropriate areas. This alternative would mostly operate in mixed lanes, crossing all intersections at grade, and would include queue jump lanes at major intersections. Dedicated BRT lanes would be provided southbound along Kenilworth Avenue, and westbound along Annapolis Road. This is the only Build Alternative that would operate on Jones Bridge Road (directly serving the National Institutes of Health and the National Naval Medical Center) and that would use the bus portion of the new Silver Spring Transit Center.

2.4.2.   Alternative 4 - Medium Investment BRT

The Medium Investment BRT Alternative is a composite of elements from the Low and High Investment BRT Alternatives. The Medium Investment BRT Alternative incorporates those lower-cost features for segments of the Low Investment BRT Alternative that perform reasonably well and those of the High Investment BRT Alternatives that provide reasonable benefits relative to the higher costs. The major incremental change for the Medium Investment BRT Alternative is that between Bethesda and Silver Spring, the transit service runs in a guideway in the Georgetown Branch right-of-way instead of along Jones Bridge Road. It would serve both the existing Bethesda bus terminal and the new south entrance to the Metro station beneath the Apex Building. At the Silver Spring Transit Center, the buses would enter on an aerial structure parallel to, but at a higher level than, the existing Metro and CSX tracks. Along University Boulevard the alternative would be in dedicated lanes and the alternative would leave Campus Drive in the University of Maryland at Regent's Drive to proceed directly through the East Campus development.

2.4.3.   Alternative 5 - High Investment BRT

High Investment BRT is structured to provide the fastest travel time of the BRT alternatives. Tunnels and aerial structures are proposed at key locations to improve travel time and reduce delay. When operating within or adjacent to existing roads, this alternative would operate largely in dedicated traffic lanes. Like the Medium Investment BRT Alternative, this alternative would serve the Bethesda Station at both the bus terminal and the new south entrance. At the Silver Spring Transit Center, the buses would enter on an aerial structure parallel to, but at a higher level than, the existing Metro and CSX tracks.

2.4.4.   Alternative 6 - Low Investment LRT

The terminal station for Low Investment LRT would be the Bethesda Metro Station with a connection to the southern end of the existing station platform (the LRT alternatives would only

serve the south entrance of the Bethesda Station and would operate there in a stub-end platform arrangement). It would operate in shared and dedicated lanes with minimal use of vertical grade separation and horizontal traffic separation. At the Silver Spring Transit Center, the light rail transit would enter on an aerial structure parallel to, but at a higher level than, the existing tracks.

This alternative would include incorporation of signal priority or queue jump lanes at major intersections where possible, to achieve measurable time savings or reliability without overly adversely affecting traffic at the intersections.

2.4.5.   Alternative 7 - Medium Investment LRT

The Medium Investment LRT Alternative is a composite of elements from the Low and High Investment LRT Investment Alternatives. This alternative incorporates those lower cost features for segments of the Low Investment LRT Alternative that perform reasonably well and those of the High Investment LRT Alternative that provide reasonable benefits relative to their higher costs. The principal incremental change for the Medium Investment LRT Alternative is the introduction of several grade separations at major roadways and more dedicated sections along roadways; however, it does not include some of the longer tunnel sections in East Silver Spring, the University of Maryland, or Riverdale Park, that are included under the High Investment BRT and LRT Alternatives.

2.4.6.   Alternative 8 - High Investment LRT

The High Investment LRT Alternative is nearly identical to the High Investment BRT Alternative, except that it only serves the south entrance of the Bethesda Metro Station.

2.5.   Build Alternatives Operations

The span of service for the Build Alternatives would mirror that for the Metrorail system, including extended hours on weekend nights (see Table 2-4).

The headways of the various Build Alternatives would vary by time period to reflect demand requirements. Proposed headways are shown by time period in Table 2-5. The span of services of the bus routes that feed the TSM and Build Alternatives would be adjusted to service the market needing extended service times.

Table 2-4:   Year 2030 Span of Service

Day of Week	Hours
Monday - Thursday	5:00 AM – 12:00 AM
Friday	5:00 AM – 3:00 AM
Saturday	7:00 AM – 3:00 AM
Sunday	7:00 AM – 12:00 AM

Table 2-5: Year 2030 Build Alternatives Headways (minutes)

Day of Week	Early AM	Peak	Midday	PM Peak	Evening	Late PM
Weekdays	10	6	10	6	10	10
Saturdays	20	N/A	10	N/A	10	20
Sundays	20	N/A	10	N/A	10	20

The fare for all of the Build Alternatives under consideration would be consistent with the current local bus fare structure, recognizing that this would increase over time. SmartCard, or some other means of electronic fare collection, would enable an integrated fare structure and convenient transfer with the other transit services in the corridor.

The end-to-end travel times and average estimated speeds for each Build Alternative are shown in Table 2-6. As expected, the High Investment LRT Alternative, with strategic grade separation and mostly dedicated or exclusive right-of-way, would have the shortest running time and the highest average speed of all the alternatives. Average station-to-station travel time estimates for the Build Alternatives are shown in Table 2-7.

Table 2-6: Year 2030 End-to-End Travel Times

	End-to-End Running Time (minutes)	Average Speed (mph)
TSM	108	9
Low Investment BRT	96	10
Medium Investment BRT	73	13
High Investment BRT	59	16
Low Investment LRT	62	15
Medium Investment LRT	59	16
High Investment LRT	50	19

2.5.1. Reliability

The overall reliability of any of the Build Alternatives would be higher than that for the No Build or TSM alternatives because portions of the service, depending on the alternative, would operate largely in dedicated lanes or exclusive right-of-way, thus removing the vehicles from the potential delays of roadway congestion. In areas where the Purple Line would operate in shared lanes, it is anticipated that queue jump lanes and signal prioritization would be implemented where possible. The High Investment Alternatives would have the highest reliability, and the Low Investment Alternatives would have the lowest reliability. Because of the terminal configuration of the High and Medium Investment BRT Alternatives at Bethesda that involves a street running loop, those two alternatives would not be as reliable as their LRT counterparts. Similarly, the Low Investment BRT Alternative with its operations along Jones Bridge Road between Bethesda and Jones Mill Road would have lower reliability than the Low Investment LRT Alternative, which would operate in the Georgetown Branch right-of-way, which is an exclusive right-of-way.

Table 2-7: Year 2030 Average Station-to-Station Travel Times (minutes)

Segment	TSM	Low Inv. BRT	Medium Inv. BRT	High Inv. BRT	Low Inv. LRT	Medium Inv. LRT	High Inv. LRT
Bethesda Metro, North entrance to Medical Center Metro	N/A	4.7	N/A	N/A	N/A	N/A	N/A
Bethesda Metro, North entrance to Bethesda Metro, South entrance	N/A	N/A	5.2	5.2	N/A	N/A	N/A
Medical Center Metro to Connecticut Avenue	N/A	6.0	N/A	N/A	N/A	N/A	N/A
Bethesda Metro, South entrance to Connecticut Avenue	10.8	N/A	5.5	5.5	4.0	2.4	2.4
Connecticut Ave. to Grubb Road	7.3	N/A	N/A	N/A	N/A	N/A	N/A

Lyttonsville to Woodside/16th Street	N/A	2.4	2.4	2.4	2.1	2.1	2.1
Woodside/16th Street to Silver Spring Transit Center	N/A	6.2	2.1	2.1	2.8	2.0	2.0
Silver Spring Transit Center to Fenton Street	5.1	4.6	3.1	N/A	3.1	3.1	N/A
Silver Spring Transit Center to Dale Drive	N/A	N/A	N/A	2.6	N/A	N/A	3.6
Fenton Street to Dale Drive	4.8	2.8	3.0	N/A	3.8	3.1	N/A
Dale Drive to Manchester Road	2.9	2.3	2.3	2.1	3.1	2.8	2.4
Manchester Road to Arliss Street	4.9	4.8	4.7	1.4	1.4	1.4	1.4
Arliss Street to Gilbert Street	6.6	6.6	3.4	4.0	3.8	3.8	3.8
Gilbert Street to Takoma/Langley Transit Center	4.8	4.8	2.3	2.2	2.2	2.2	2.1
Takoma/Langley Transit Center to Riggs Road	5.8	5.6	2.7	1.7	2.4	2.4	1.7
Riggs Road to Adelphi Road	6.0	5.7	5.6	3.1	3.3	3.3	3.1
Adelphi Road to UM Campus Center	4.0	3.7	2.9	2.6	2.9	2.9	2.6
UM Campus Center to UM East Campus	8.6	8.6	3.0	2.9	3.0	3.0	2.9
UM East Campus to College Park Metro	2.0	2.2	3.0	3.0	3.0	3.0	3.0
College Park Metro to River Road	2.0	1.8	1.9	1.9	1.9	1.9	1.9
River Road to Riverdale Park	5.5	5.0	4.3	3.2	4.6	4.6	3.1
Riverdale Park to Riverdale Road	4.4	4.4	4.7	2.9	4.8	4.8	2.9
Riverdale Road to Annapolis Road	4.7	4.0	3.6	3.5	3.5	3.5	3.3
Annapolis Road to New Carrollton Metro	4.6	4.4	3.8	3.5	3.9	3.9	3.6
Total Running Time (rounded up to the nearest minute)	**108**	**96**	**73**	**59**	**62**	**59**	**50**

Note: Times represent the average of morning and afternoon peak period travel times in the eastbound and westbound direction, which may vary with the specific period coding assumptions.

2.5.2. Ridership

Ridership forecasts are used to gauge the comparative attractiveness of alternatives under consideration. They are measured in terms of daily passengers and daily boardings, also called linked and unlinked trips. A passenger, or linked trip, is defined as travel from trip origin to trip destination, regardless of the number of transfers or mode changes required. A boarding, or unlinked trip, is counted as the number of times a person enters a vehicle for travel, inclusive of transfers. One linked trip from origin to destination could comprise multiple unlinked trips.

Purple Line ridership forecasts were measured in terms of total and new daily transit trips (linked), peak period boardings and alightings by station, and by peak period line volumes.

2.5.3. Total and New Transit Trips

The Build Alternatives would generate an approximately one percent increase in total regional transit ridership over the No Build Alternative. Detailed ridership forecasts are shown in Table 2-8. The results of the ridership modeling would indicate that forecast ridership on the Purple Line will not be the key determinant in selecting a preferred Build Alternative, but rather the results of the environmental, traffic, and cost-benefit analyses.

2.5.4. District–to-District Travel Patterns

The Washington metropolitan region was defined as a set of districts to enable a discussion of the current travel patterns (see Figure 2-2). A set of districts are identified around the major activity centers of Bethesda, Silver Spring, College Park/University of Maryland, and New Carrollton. Three additional districts are the "wedge" areas in between the major activity centers, Connecticut Avenue-Lyttonsville, Takoma Park-Langley Park, and Riverdale. These seven districts constitute the Purple Line corridor.

Other districts are used to define major sections of Washington, DC and travel market areas around the Metrorail lines (both branches of the Red Line, the Green Line, and the Orange Line) running to the north and northeast of the corridor. The rest of the region is defined by larger districts for the remainder of Maryland and the areas of Virginia.

The Purple Line corridor has approximately 169,000 daily transit trips that have one or both ends of the trip in the corridor. This represents some 9.5% of the transit trips for the Washington region. Some 44,000 of these transit trips have both ends of the trip within the Purple Line corridor while 60,000 transit trips are between the corridor and some part of Washington, DC. A large number of the remaining trips are associated with districts to the north or northeast of the Purple Line corridor along the Metrorail lines. The majority of the trips in the corridor are associated with the major activity centers, 134,000, while the other 35,000 are associated with the wedge districts. Of the trips associated with the major activity centers, only 9,000 are from one major activity center to another. For the wedge district trips, 8,400 are associated with the major activity centers with 15,400 associated with the Washington, DC districts.

Table 2-8: Year 2030 Total Daily Linked Transit Trips

	Type of Trip	No Build	TSM	Low Invest. BRT	Medium Invest. BRT	High Invest. BRT	Low Invest. LRT	Medium Invest. LRT	High Invest. LRT

Total Transit Trips		**1,355,395**	**1,363,585**	**1,366,773**	**1,370,704**	**1,373,059**	**1,373,612**	**1,374,602**	**1,376,167**
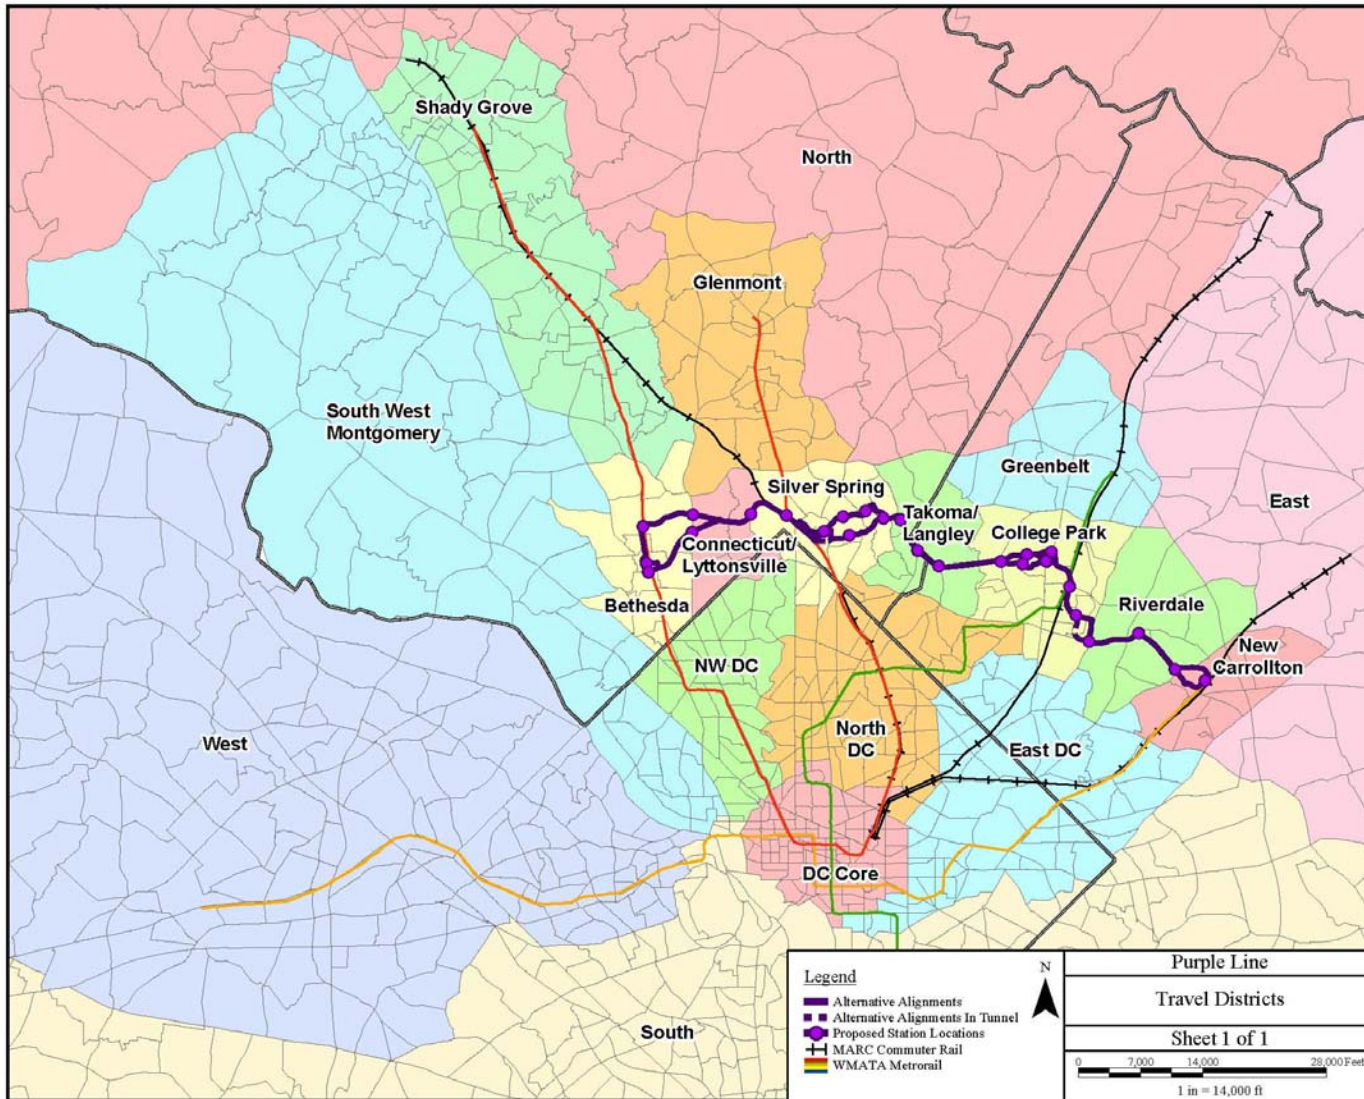

Figure 2-2: Travel Districts

What this information shows is that while there is quite a bit of existing transit travel within the Purple Line corridor, that number of corridor trips associated with areas outside the corridor is greater, i.e., corridor trips associated with Washington, DC and the area north along the Metrorail Red, Green, and Orange Lines that run through the major activity centers, especially up toward the Shady Grove-Rockville area and Glenmont area. While the major activity center districts account for the majority of the trips, a substantial number of trips are associated with the wedge districts, those areas not presently served by Metrorail and dependent on street-running bus service operating in congested mixed traffic, are linked with either one of the major activity centers or areas reachable via the Metrorail system, especially Washington, DC.

By the year 2030, daily transit trips are forecast to grow by 953,000, 52%, for a total of 2,711,000. Transit trips associated with the corridor will grow by 38%, to 234,000, while trips within the corridor will grow by 43% to 62,000 trips. While the general pattern and distribution of these transit trips would be similar to current trips, the level of growth is substantial, increasing the severity and the magnitude of the mobility needs of Purple Line corridor travelers.

The TSM Alternative would increase daily total transit trips by 16,000 over the 2030 Future No Build. Of these new transit trips, 13,200, over 80%, are between the corridor and areas outside the corridor; while the other 2,800 trips are within the corridor. The TSM alternative provides most of the benefits to corridor trips to access the transit services that connect with the rest of the region; rather than travel among districts within the corridor.

All the Build Alternatives have a similar pattern of change in the travel patterns, but because they have a similar alignment and station definitions and vary primarily by travel times, have different amount of new transit trips with High Investment LRT generating the highest number of new transit trips, and Low Investment BRT generating the lowest.

2.5.5. Daily Line Haul Boardings

Table 2-9 shows the total daily boardings for each of the alternatives. A boarding is when a person uses the transit service for all or part of trip. The boardings are shown for trips only using the Purple Line (over half the boardings), trips primarily on Metrorail and using the Purple Line for part of that trip, and trips primarily on MARC and using the Purple Line for part of that trip. High Investment LRT attracts the highest number of boardings followed by the other LRT alternatives and then the BRT alternatives.

Table 2-9: Year 2030 Daily Purple Line Ridership

Transit Ridership (daily boardings)	TSM	Low Invest. BRT	Medium Invest. BRT	High Invest. BRT	Low Invest. LRT	Medium Invest. LRT	High Invest. LRT
Purple Line	12,700	22,200	29,300	33,800	32,500	33,900	36,100
Purple Line via Metrorail	2,100	16,700	21,100	23,700	25,300	27,200	30,500
Purple Line via MARC	--	1,100	1,400	1,400	1,500	1,500	1,500
Total	**14,800**	**40,000**	**51,800**	**58,900**	**59,300**	**62,600**	**68,100**
New Transit Trips Relative to No Build	**8,200**	**11,400**	**15,300**	**17,700**	**18,200**	**19,200**	**20,500**

2.5.6. Daily Station Boardings

Daily boardings, by station, for each of the Build Alternatives are shown in Table 2-10. Not surprisingly, the highest number of riders is attracted by the High Investment LRT Alternative, followed by the Medium Investment LRT Alternative, and the Low Investment LRT and High Investment BRT, which attract approximately the same number of riders. All of the Build Alternatives, except the Low Investment BRT, have the same top three stations for daily boardings: the western terminus in Bethesda (north or south), the Silver Spring Transit Center, and the College Park Metro Station. For the Low Investment BRT Alternative, the top three stations for daily boardings are the Silver Spring Transit Center, US 1 and College Park Metro Station.

2.5.7. Station Mode of Access

At all the stations along the Purple Line alternatives, walk and feeder bus access would be the principal means of access and egress. At the Bethesda, Silver Spring, College Park, and New Carrollton Stations, transfer with Metrorail would be the major connection. With the exception of Bethesda, MARC connections would also be available at those stations. Major bus interfaces will occur at Bethesda, Silver Spring, Takoma/Langley, College Park, and New Carrollton stations. All these connections are with existing services. Some of the existing bus services will be modified to better integrate with the Purple Line stations. Some existing bus services that duplicate the Purple Line service may be cut back. While parking facilities exist at the four Metrorail stations that connect with the Purple Line, no new park-and-ride facilities would be provided at any of the Purple Line stations. Some kiss-and-ride could occur at some of stations, as occurs today at some bus stops, but additional kiss-and-ride facilities are being considered at Connecticut Avenue at the Georgetown Branch right-of-way, and at Lyttonsville.

Table 2-10: Year 2030 Build Alternatives Daily Boardings

2.5.8. University of Maryland Student Travel

The travel of University of Maryland employees, faculty, and staff to and from the campus is captured within the regional travel model forecasts and these trips are included in the forecasts for the Purple Line. Many of the 36,000 students live on campus or in nearby housing within walking distance of the campus. Others live off campus and commute to school. These trips are not as concentrated in the peak periods as employee trips and are not as regular, given that the university is not in full session over the summer and various break periods.

A portion of these commuting students would use the UM shuttle, TheBus and WMATA bus services. The UM Shuttle does provide connecting services to the College Park Metrorail Station and downtown Silver Spring, including the Metrorail station.

On-campus students also use the existing bus services to access off-campus destinations, including the College Park and Silver Spring Metro Stations. Many of these trips again occur outside the normal commuting peak periods – in evenings and on weekends. The UM Shuttle provides a regular and relatively frequent service between the campus and the College Park Metrorail station throughout most of the day, carrying about 3,000 trips on a typical day. The service connecting with Silver Spring carries about 500 trips on a typical day. According to the Shuttle operator, approximately half of the users are students, or about 1,700 per day. With the Purple Line in place, these shuttle services would be discontinued or re-routed and these 1,700 would likely use the Purple Line. Some portion of these trips is likely already included in the regional model forecasts. As noted earlier, the University faculty and staff are fully accounted for by the regional forecasting model. For the purposes of the comparison of the alternatives, the analysis assumes that these trips are included in the regional forecasts and would be similar across all the alternatives.

For the travel forecast for the further development of the Locally Preferred Alternative, a separate student trip purpose forecast will be developed.

2.5.9. Special Event and Special Generators Trips

Venues such as sport stadiums and arenas and events such as major festival or holiday fireworks displays generate trips that may not be included in the regional travel forecasting process. Washington, DC is the site of many of special events and special generators that occur with enough regularity and frequency that these are included in the regional model forecasts. Within the corridor, the principal special event and special trip generator venue is the University of Maryland campus in College Park, with Byrd Stadium, Comcast Center, and Clarice Smith Performing Arts Center. Byrd Stadium seats 50,000 people and hosts five to seven home weekend football games annually. The UM Shuttle carries a total of 2,000-3,000 trips (i.e. 1,000 to 1,500 individuals) for each game. This would mean that between 2 and 3 percent of the total attendance uses the Shuttle. For basketball, soccer, lacrosse, field hockey, and events at the Clarice Smith Performing Arts Center, shuttle ridership is relatively low. While the University of Maryland does not have actual records, on an annual basis the total number of special event and special generator trips on the Shuttle is between 40,000 to 50,000. Not all these trips would be candidates for the Purple Line; however, the Purple Line could make using transit for these

types of trips associated with the University of Maryland more attractive, especially if the Purple Line is centrally located on Campus Drive.

Most of these trips will be outside the normal weekday peak period, being on weekday evenings and on weekends. Averaging out over a typical weekday, these trips would represent about 170 trips, which is less than one percent of the daily usage of the Purple Line alternatives. So, while the Purple Line would provide an improved and attractive means of accessing the events at the University of Maryland and other venues, the amount will be a relatively small compared to the total usage.

2.5.10.   Transportation System User Benefits

Transportation system user benefit is a measure of benefits that would accrue to users of the transportation system as a result of implementing an alternative. The users include both existing system users such as existing transit riders who might benefit from a faster trip or more convenient access to the service, as well as new transit users. These benefits include both time and monetary costs and are expressed in terms of minutes saved. The user benefit is calculated within the region's mode choice model for all alternatives and uses a measure of the traveler's value of time to convert monetary and other costs to their equivalence in time, which is added to actual time savings. Additional user benefits can accrue to users of fixed guideway transit services due to attributes of these systems not reflected strictly in terms of travel times and out-of-pocket costs. These are referred to as "mode specific attributes" and account for perceived benefits that users feel they receive for amenity, comfort, reliability, safety and other characteristics associated with the mode. The degree to which these additional benefits accrue to the users depends on the definitions of the alternatives. These would accrue to all the BRT and LRT alternative users to varying degrees depending on the specific attributes of the alternative. In this way, the measure includes a more comprehensive accounting of the total costs of travel.

Table 2-11 shows the total user benefits for the TSM and each of the Build Alternatives. As the table shows, the TSM alternative would generate more than 400,000 minutes of user benefit (about 6,700 hours) to travelers in the Washington metropolitan area each day. All of the Build Alternatives would generate higher user benefits than the TSM. The Low Investment BRT alternative would offer 75 percent more user benefits than the TSM, while the High Investment LRT Alternative would generate 271% more user benefits over the TSM alternative.

Table 2-11: Year 2030 Daily Transportation System User Benefits with Mode Specific Attributes

	Daily User Benefits (minutes)	Increase in Daily User Benefits over TSM (minutes)	Percent over TSM
TSM	401,200	--	--
Low Investment BRT	702,300	301,100	75%
Medium Investment BRT	1,022,200	621,000	155%
High Investment BRT	1,258,000	856,800	214%
Low Investment LRT	1,180,600	779,400	194%
Medium Investment LRT	1,303,800	902,600	225%
High Investment LRT	1,489,600	1,088,400	271%

2.5.11.   Farebox Revenue

Farebox revenues are those that are collected from passengers using the transit services for making trips. People use a variety of means to pay fares, including cash, tokens, passes, and electronic farecards. Passes and farecards for multi-trip, or weekly and monthly periods are typically purchased at a discount. Fares revenues include both fares at the initial boarding of the trip as well any transfer costs. The Purple Line corridor has a number of transit operators including WMATA, MARC, Ride On, and TheBus. For the purposes of this analysis, the operator of the Purple Line would be the MTA.

With the increase in systemwide transit users forecasted for the alternatives, the increase in systemwide farebox revenues relative to the 2030 No Build are presented in Table 2-12.

Table 2-12: Year 2030 Annual Change in Systemwide Farebox Revenues by Alternative Relative to No Build

Alternative	Annual Change
TSM	$3,423,000
Low Investment BRT	$5,829,000
Medium Investment BRT	$7,500,000
High Investment BRT	$8,452,000
Low Investment LRT	$8,921,000
Medium Investment LRT	$9,3556,000
High Investment LRT	$10,167,000

3. Supplemental Forecast Input and Results by Alternative

The following section provides for each alternative further information and assumptions used as input to the travel forecasts, as well as more detailed forecasts results which supplement the information provided in the previous section.

3.1. No Build

3.1.1. Assumptions

The 2030 No Build network consisted of the Metropolitan Washington Council of Governments (MWCOG) officially adopted 2030 network as provided in the MWCOG model version 2.1D#50 with the following changes:

- Zone realignments and subdivisions in Montgomery County and the requisite network changes,

- Network corrections as identified by Michael Baker Corporation in conjunction with Montgomery County,

- Removal of the CCT transit network coding from the Long Range Plan

- Removal of the Anacostia LRT

3.9. Comparative Summary

Information is provided below on the background bus system as well as additional information formatted to show comparisons across alternatives.

3.10. Background Bus Assumptions

Bus routes listed in the following table were diverted to connect to the given stations by alternative in order to provide feeder service to the Purple Line For the 2030 networks.

Table 3-53: Background Bus

Stations	TSM	Low Inv. BRT	All Others
Connecticut Avenue			J1, J2, J3
Lyttonsville Place		RO1, RO4	RO1, RO4
Grubb Road	RO2 (AM)		
Arliss/Piney Branch	RO 12, RO 13	RO 12, RO 13	RO 12, RO 13

The J4 bus route, present in the 2000 base year has been discontinued and removed from all future year forecast networks. In addition, route RO15 has been removed. For the Low BRT, route J1 has also been removed to eliminate redundant service.

Table 3-54: Year 2030 Trips, Boardings and User Benefits
